I'm Valter Lima Mesquita, a brazilian full-stack developer.

Since I started programming sometime ago, I have an itching for learning new things and technologies. I was and I still am very restless when I feel I stopped learning. That's basically my stage right now: I quit my last job because it was too old-fashioned and boring workplace.

I started as an intern in an Hosting and Internet Access Provider Company and I had to learn new stuff asap because we had a lot of tickets from the clients. So I learned C# to manage the control panel hosting stuff; learned PHP and SQL to improve the company's CRM and to maintain three Wordpress Websites; learned Linux, Asterisk and ASP.NET to fix PABX IP bugs; and learned NodeJS and Angular 1 to create and maintain an Callcenter Monitoring Tool for the PABX IP.

In my next job, I was responsible for creating a CRM responsible for selling training courses, like MBA and Vocational. This included all the basic steps of software development: requirement analysis, design, implementation, testing, evolution, staff training, etc. For this job I had to master my skills with PHP and SQL Server. I became bored and left after one year and nowadays I'm working on a freelance basis.

These jobs helped me to be what I am, a self driven developer with over 5 years of experience in developing, debugging and maintaining Applications and Websites. I'm a devOps when needed, helpful team player by the day and a lone coder in the night. I have an awesome google skill to solve bugs and I'm an enthusiastic gamer.

In the last few months, I've been studying hard trying to master Javascript, it's libraries and frameworks, like Angular 2, React and Node. These are some of the technologies I've been using on my repositories in GitHub.

Ultimately, I'm currently looking for a remote opportunity to improve my skills, meet new people and discover new technologies and companies. Let's talk!
